

## Stretch Wrap & Stretch Film

Economical hi-clarity, hi-cling stretch film / stretch wrap is available in a variety of sizes, from convenient hand held tubes to oversized machine rolls.

As well as standard polythene, you can order our extensive range of stretch wrap and stretch film in the following materials:

**Polylite**

A 100% recyclable, tough, lightweight film that offers outstanding strength at lower gauges and reduces the weight of polythene consumption (and thus the cost) by up to 20%. Our PolyLite machine-stretched films are supplied using a multi-layer co-extruded material that is either pre-stretched or power pre-stretched up to 300% offering savings of up to 60% on ordinary polythene film wrap.

**Polyair**

Eco-friendly polythene that is oxy-degradable in just 2–3 years. This material contains **d<sub>2</sub>w**<sup>®</sup> additives that break down the carbon-carbon bonds within the polythene, leading to much faster deterioration than normal polythene.

## Stretch Wrap & Stretch Film

### Advantages of pre-stretched film:

- Low noise
- Sticky only on the side that needs to stick to the pallet
- Pre-stretched to maximise yield
- Supplied on wider rolls to give maximum output and reduce the time taken to wrap each pallet
- Fewer roll changes mean less waste and less cost per pallet to you

Alongside our standard stretch products we offer pre-stretched or power pre-stretched film that comes supplied on heavy-duty lightweight cores – making it more economic to use.

Pre-stretched wrap and film decreases the weight of the roll and the cost to you per length, but still retains the same high performance levels. By using fold-over edges top and bottom, we ensure sufficient strength for the most exacting pallet-wrap requirements. In fact, we guarantee to provide you with the highest film yields in Europe.

Our hand-held film uses the same lightweight pre-stretched film as our standard machine stretch film. It is lightweight but very strong; our stretch-wrap material is an economic solution for all hand pallet and standard machine applications.

It has a super-tight wrap that helps reduce separation during transit and increases security. It is available to fit all standard hand pallet rollers with the option of coreless rolls for improved efficiency, better yield and less waste for disposal.

Power pre-stretched machine film is a five-layer cast film, which enables a minimum 13% down-gauge, leading to a further increase in yield. It is supplied using heavy-duty, lightweight cores, further improving yield.

For longer items we supply spiral wrap stretch films for all types of commercial and industrial applications, they provide the same benefits as our power, pre-stretched machine films.

Contact our helpful sales personnel to find out more about our extensive range of stretch wrap and films and how changing to either our Polylite or Polyair materials will help you to reduce both your costs and your environmental footprint.
